

System Architecture — Final Design Correction

This correction is the authoritative phase-one data and access boundary for the System Architecture and Technology Stack document.

Final architecture decisions

The original architecture PDF is retained because its authoring source is not tracked in the repository. This page is inserted as its first page and supersedes any earlier wording that conflicts with the ERD, relational schema, class diagrams, or requirements traceability artifacts.

Architecture area	Final phase-one decision
Identity	Authentication is delegated to a managed identity provider. USER stores the provider-issued identity_subject ; no local password hash is stored.
Consent	CONSENT_RECORD records the user, purpose, policy version, method, granted/withdrawn status, and timestamp. Consent is an auditable history, not a single account flag.
Class enrolment	A learner joins a LEARNING_CLASS with its join_code . The phase-one design has no invitation-link entity or acceptance flow.
Teacher access	Access is role-based and limited to active class enrolment. The system uses learner terminology outside teacher-facing copy.
Audio and external analysis	Recitation audio remains in memory for analysis and is not retained. External processing is not a deployment assumption: it requires a completed vendor and PDPL transfer review before use.

Submission use

Read this correction together with the architecture document. It preserves the existing component, data-flow, and no-audio-retention design while resolving the final identity, consent, enrolment, terminology, and external-processing decisions.
